Exposure to radio waves (SAR)

When your device, the Wi-Fi hotspot functionality or the Bluetooth hands free functionality is turned on, it emits low levels of radio frequency energy (radio waves). The radio wave exposure guidelines employ a unit of measurement known as the Specific Absorption Rate, or SAR. This device meets the international SAR limit guidelines and your device's SAR values are below these limits. The Specific Absorption Rate for your device is 0.86 W/kg averaged over 10g when worn on your wrist.

SAR data information is provided for residents in countries that have adopted the SAR limit recommended by the International Commission of Non-Ionizing Radiation Protection (ICNIRP), which is 2 W/kg averaged over ten (10) gram of body tissue or recommended by the Institute of Electrical and Electronics Engineers (IEEE), which is 1.6 W/kg averaged over one (1) gram of body tissue. Products used on limbs has a international limit based on ICNIRP recommendations at 4 W/kg averaged over ten (10) gram of body tissue. These requirements are based on scientific guidelines that include safety margins designed to assure the safety of all persons, regardless of age and health.

Tests for SAR are conducted using standardized methods with the device transmitting at its highest certified power level in all used frequency bands, but because the device is designed to use the minimum power necessary to access the chosen network, the actual SAR level can be well below this value. While there may be differences between the SAR levels of various device models, they are all designed to meet the relevant guidelines for exposure to radio waves.

Your device is used worn on your wrist and has been tested when positioned at 0 mm from the body without any metal parts in the vicinity of clock or when properly used with an appropriate accessory and worn on the wrist.

The WHO (World Health Organization) has stated that current scientific information does not indicate the need for special precautions for the use of clocks. For more information about this topic, please refer to the WHO document (Memo No. 193, Electromagnetic Fields and Public Health, Mobile phones and their base stations), available at: <http://who.int/emf>.

**Before a device is available for sale to the public in the US, it must be tested and certified by the Federal Communications Commission (FCC) that it does not exceed the limit established by the government-adopted requirement for safe exposure*. The tests are performed in positions and locations (i.e., by the ear wrist and worn on the body) as required by the FCC for each model. The FCC has granted an Equipment Authorization for this device with all reported SAR levels evaluated as in compliance with the FCC RF exposure guidelines. While there may be differences between the SAR levels of various devices, all devices granted an FCC equipment authorization meet the government requirement for safe exposure. SAR information on this device is on file at the FCC and can be found under the Display Grant section of <http://transition.fcc.gov/oet/ea/fccid/> after searching on the FCC ID PY7-RD0090 for your device. Additional information on SAR can be found on the Mobile Manufacturers Forum EMF website at <http://emfexplained.info/>.
